Patent No. 6660838
GENERAL INFORMATION:
APPLICATION:
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR THERAPY OF LUNG CANCER
FILE REFERENCE: 210121.455C2
CURRENT APPLICATION NUMBER: US/09/221,107
CURRENT FILING DATE: 1998-12-22
NUMBER OF SEQ ID NOS: 161
SOFTWARE: Patentin Ver. 2.0
LENGTH: 449
APPLICANT: Bangur, Chaitenya S.
APPLICANT: Hosken, Nancy
APPLICANT: Fanger, Gary R.
APPLICANT: Li, Samuel X.
APPLICANT: Li, Samuel X.
APPLICANT: Li, Samuel X.
TAPLICANT: Wans, Aljun
APPLICANT: Weeky, Yasir A.W.
TITLE OF INVENTION: AND DIAGNOSIS OF LUNG CANCER
TITLE OF INVENTION: AND DIAGNOSIS OF LUNG CANCER
FILE REFERENCE: 210121.455C9
CURRENT APPLICATION NUMBER: US/09/606,421B
CURRENT FILION DATE: 2000-06-28
SOFTWARE: FastSEQ for Windows Version 3.0
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 20
LENGTH: 449
TYPE: DNA

eIF3-p40; eukaryotic translation initiation factor 3; p40 subunit; human; chromosome 8q23; breast carcinoma; prostate carcinoma; overexpression; gene amplification; oncogenesis; cancer; tumour; EST 346021; expressed sequence tag; ss. Detecting and modulating the expression of p40 subunits of eukaryotic translation initiation factor 3 for the diagnosis, prognosis and treatment of breast and prostate carcinomas. Ovod V; (FIIM-) FINNISH IMMUNOTECHNOLOGY LTD. Nupponen N, Human eIF3-p40 coding sequence. 99WO-FI001039. 98FI-00002722. Visakorpi T, Isola J, WPI; 2000-431613/37. WO200036144-A2. Homo sapiens. 15-DEC-1999; 16-DEC-1998; 22-JUN-2000.

Example 6; Page 23-24; 24pp; English.

The invention relates to novel methods and reagents for detecting and quantifying the expression of the p40 subunit of human e173-p40 (eukaryotic translation initiation factor 3) and for treating conditions associated with inappropriate expression of e173-p40. e1F-p40 is associated with the oncogenesis of breast and prostate cancers. The e173-p40 gene is located on the long arm of chromosome 8 (8q23). The long arm of chromosome 8 is one of the most common regions that is amplified in

cancers of several organs, especially carcinomas of the breast and prostate. eIF3-p40 is also overexpressed in a large fraction of breast and prostate cancer, indicating that it is a target gene for 8q amplification. eIF3-p40 protein, its functional variants or fragments, and anti-eIF3-p40 antibodies may be used as diagnostic and therapeutic expression of eIF3-p40. The present sequence represents the coding sequence of the human eIF3-p40 gene, which is derived from EST (expressed sequence tag) 346021

The invention relates to novel therapeutic compounds, that are designed to enhance binding to MRC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules.

Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen EIP3 (melanoma antigen cells characterised by expression of antigen or polypeptides conjugated to a detectable agent may be used in diagnostic procedures, such as in the detection and purification of antibodies, and as immunogens for celection of antibodies. The polymucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm cransduction of the polymucleotides into host cells. The current sequence creptesents the human melanoma antigen eukaryotic initiation factor 3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  엄
                                                                                                                                                                                                                                   The invention relates to aiding in the diagnosis of a neoplastic condition or susceptibility to a neoplastic condition of an animal cell contistion or susceptibility to a neoplastic condition of an animal cell eukaryotic translation initiation factor 3 (e173) protein in a test sample isolated from the cell or tissue, and diagnosing a neoplastic condition or susceptibility to a neoplastic condition based on the amount of expression of the eIF3 protein. The methods, compounds and kits are useful in therapeutics, diagnostic and screening methods for human cancer and related malignancies, e.g. ovarian, breast, lung, colon, prostate, pancreatic or gastrointestinal cancer, or melanoma. The present sequence represents the human antigen eIF3 encoding cDNA

                                                                                                                                                                                                                                                                                                                           This invention relates to novel methods for diagnosing and monitoring autoimmune and chronic inflammatory diseases. Specifically, it refers to the identification of genes that have a clinical utility as diagnostic tools for the management of, in particular, patients with systemic lupus erychematosis (SLB) or rheumatoid arthritis (RA). Accordingly, the present invention describes a method for determining the levels of multiple differentially expressed genes of a patient, in a concerted manner, in order to achieve an improved diagnostic assay with sensitivity and specificity for the disease in question. As such, these genes are useful for the diagnosts of various other inflammatory disorders including cholecystitis, Sjogren's disease, CRBST syndrome, scleroderma, ankylosing spondylitis, ulcerative colitis, primary sclerosing cholangitis, appendicitis, diverticulitis, and primary bilary sclerosis. This polynucleotide is a DNA sequence representing human mRNA that is differentially expressed in patients with SLB, used in an exemplification
                                                                                                                                                                                                                       ö
                                                                                                                                                                Diagnosing or monitoring autoimmune and chronic inflammatory diseases, such as rheumatoid arthritis, systemic lupus erythematosus, ulcerative colitis, psoriasis and asthma by detecting the expression level of one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1280 BP; 446 A; 273 C; 274 G; 287 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    540
                                                                                                                                                                                                                                                                                                   The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

                                                                                                                                                                                                             Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer.
                                                                                                                                                                                                                                                                                                               AMPISSES to AAFIESOS encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointesting, nephrocropic, antinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with che novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of polymelectides or polypeptides of the invention; and methods of polymelectides or polypeptides of peventing, treating or invention further discloses methods of peventing, treating or and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the contion; methods for the polymerchotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC31861-ADC32627) and the polypeptides encoded by the contigs (ADC32628 CADC33394). The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of
New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
                                                                                                                                                                                                                                                                                                                                                                                            biodiversity assessment; Parkinson's disease; Alzheimer's disease; neurodegenerative diseases; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autoimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 8p22; gene; ss.

data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anaemia, platelet canders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 192

```
domains) and polypeptides may be useful for screening molecules that inhibit human immunodeficiency virus (HIV), as well as during gene therapy procedures. The siRNAs (silencing RNAs) targeted against cellular proteins interacting with HIV-1 integrase, LEDGF, MCM7, HBD1, Snurportin, VBP1, Transportin-SR and EIF3S3, are useful in preparing a medicament for treating HIV-1. The current sequence is that of the human SID DNA of the

                                                                                                                                                                                                                                                                                                                                    AAH82377 to AAH83878 represent human ovarian tumour-associated polynucleotide sequences which encode ovarian tumour proteins. The ovarian tumour protein and polynucleotide sequences have cytostatic activity, and can be used in gene therapy and vaccine production. The ovarian tumour proteins and polynucleotides can be used to inhibit the development of cancer, particularly ovarian cancer. They can also be used to diagnose the onset and progression of cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel complex between two interacting proteins listed within the specification. The complex of the invention demonstrates anti-HIV activity whilst the SID (selected interacting domains) and polypeptides may be useful for screening molecules that inhibit human immunodeficiency virus (HIV), as well as during gene therapy procedures. The sIRNAs (silencing RNAs) targeted against cellular proteins interacting with HIV-1 integrase, LEDGF, MCM7, HBO1, Surrportin, VBP1, Transportin-SR and EIPS3, are useful in preparing a medicament for treating HIV-1. The current sequence is that of the human SID DNA of the

(HUMA-) HUMAN GENOME SCI INC.

Rosen CA; Birse CE,

WPI; 2002-147878/19. P-PSDB; ABP42329 Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological

Claim 1; SEQ ID NO 1286; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-CA ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also cencompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen of ovarian antigen polymucleotides against human ovarian antigen of ovarian antigen polymucleotides against human ovarian antigen of ovarian antigen polymucleotides against human ovarian antigens, and the use of ovarian antigen polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast cancer, and disorders (e.g., infertility, disorders of pregnancy, anovulation, oployestic ovary syndrome, ovarian or breast origin, reproductive system disorders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic disorders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastriis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders and inforders autoimmune oophoritis, systemic lupus erythematosus), cresping tor autinary system disorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may also be used in screening for compounds continued polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present colypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present invention. Note: The sequence data for this patent disorders invention, but was obtained in electronic format directly form planted pot fire printed specification, but was obtained in electronic f
